AI Health Analysis

Dear moye moye, your health data shows several urgent concerns that need immediate attention. Your blood pressure has been consistently high, with some readings indicating a hypertensive crisis, and your average oxygen saturation is critically low. Additionally, you've experienced recurring fevers and a significant change in weight. Given your existing chronic conditions, it's crucial to consult a doctor without delay.

BP: Your average blood pressure of 138.6/100.0 mmHg indicates Stage 2 Hypertension, with the diastolic pressure being particularly high. Furthermore, a peak reading of 190/120 mmHg suggests you experienced a hypertensive crisis, which is a medical emergency and needs immediate attention.

SpO2: Your average oxygen saturation (SpO2) of 85.0% is critically low, and your data shows multiple instances of critically low SpO2. This is a serious concern, as it indicates your body may not be receiving enough oxygen, and requires urgent medical evaluation.

Your check-in data suggests low average sleep and minimal physical activity. Prioritizing consistent sleep and incorporating regular, moderate physical activity after medical consultation can significantly improve your overall well-being and help manage your health conditions.

Recommendations

It looks like your health goals haven't seen much progress yet, as the current values are not recorded; let's work on consistently tracking your progress towards them.

- 1. Consult a doctor immediately:** Due to critically low SpO2, hypertensive crisis readings, and persistent fever, urgent medical evaluation is essential to diagnose and manage these serious issues.
- 2. Strictly adhere to prescribed medications:** For your chronic conditions (Diabetes, Hypertension, Heart Disease), consistent and correct medication intake is vital. Do not alter doses without medical advice.
- 3. Monitor vital signs diligently:** Continue daily monitoring of blood pressure, SpO2, and temperature, and accurately record all readings to share with your healthcare provider.
- 4. Prioritize a heart-healthy and diabetes-friendly diet:** Focus on low-sodium, low-sugar, whole-food options to help manage blood pressure, blood sugar, and weight. Seek advice from a nutritionist if possible.
- 5. Address sleep and physical activity:** Aim for 7-8 hours of quality sleep nightly. Once medically cleared, gradually increase your physical activity with light, regular exercise suitable for your heart condition, such as daily short walks.

■ Attention Required

- Hypertensive Crisis (max BP 190/120 mmHg, requires immediate medical attention)
- Critically Low Oxygen Saturation (avg SpO2 85.0%, multiple critical low flags, urgent medical intervention needed)
- Persistent High Fever (avg temperature 38.7°C, 4 fever flags, needs medical evaluation)
- Significant Weight Change (22 kg increase over 30 days, requires urgent medical investigation)
